Supplementary Information

Title
Battling bacterial infection with hexamethylene diisocyanate cross-linked and Cefaclor loaded collagen scaffolds

**Figure S1:** Morphology analysis revealed a collapsed structure for the non-cross-linked scaffolds, whilst all cross-linked groups exhibited a three-dimensional and very well defined porous structure with no apparent differences among them.
**Figure S2:** Morphology assessment of the drug-loaded scaffolds revealed that Ran formed a particulate on the surface of the scaffolds, whilst Cef was completely absorbed.
