Figure 6(a) was misplaced with a repetition of figure 4 in the original version of the paper. Here we give the correct figure 6.

Figure 6. (a) The alpha-relaxation times shown in figure 4 (of the original article) plotted as a function of $X = e(\rho)/T$, with increasing $d \log e(\rho)/d \log \rho$ as $\rho$ increases. (b) Density-dependent activation energy $e(\rho)$ (dashed line) used in the scaling variable $X = e(\rho)/T$ for collapsing data in (a) (the associated $n(\rho) = d \log e(\rho)/d \log \rho$ increases from 1.5 to 3.5 in the density range under study). We also display the power law giving the best scaling, $\rho^{-2.5}$, at low density (full line).
