In this work, there was an error in the definition of the cumulative large cold-spot metric, LCS_D. The correct reading of equation (2) should be:

\[ LCS_D = \frac{1}{S_D} \sum \sum M_{\text{cold}}(i_D, z) z^2. \]

In addition, the value of LCS98% on the second row of table 1 was miscalculated. The correct value is 0.33.

It should also be emphasized, that the cumulative large cold-spot metric was intended to be used as a complement to conventional dose-volume metrics, as it does not in itself contain any absolute volumetric information. In our implementation, the summation in equation (2) was performed over the entire range of \( z \) values, but it may also be relevant to exclude small cold spots below a certain threshold volume.
